Searching

Request

The search request is sent via `GET` HTTP method, and accepts the following parameters:

Attribute	Type	Required	Description
checkIn	Date	Required	Service start date, expected format: YYYY-MM-DD.
nights	Int	Required	Number of nights
guests	Struct	Required	The guest configuration for the stay, see <code>Guests List</code> section below for structure
hotelIds	List	Required	A comma separated list of hotel ids
customerNationality	ISO 3166-1	Optional, but encouraged	2 letter country code of the customer nationality
ratePlans	List	Optional	Comma separated list of private rate plans
currency	ISO 4217	Optional	A single currency to normalize all property currency to, this is used for display purposes only
filter.charge	enum	Optional	filter to receive only 1 type of rates, either pay-at-the-hotel or pre-paid-by-the-agent (possible values: customer / agent)

Attribute	Type	Required	Description
meta	Array	Optional	Additional parameters for the search context, see Search Attributes section below

***i* NOTE**

While sending the customer nationality is not mandatory, it is highly advised to do so since some properties distribute rates based on nationality, and may not respect reservations made with a different nationality than the actual guest nationality.

Guests List

The guests should be sent as a string in the following format: adult-child age,child ageMultiple rooms are to be separated with a dot (".").

Examples:

- Searching for 1 room, for 2 adults: `guests=2`
- Searching for 2 rooms, each for 2 adults: `guests=2.2`
- Searching for 3 rooms, one for 1 adult, and second for 2 adults, third for 3 adults: `guests=1.2.3`
- Searching for 1 room, for 2 adults and 2 children aged 11 and 12: `guests=2-11,12`
- Searching for 2 rooms, each for 2 adults, and 2 children aged 11 and 12: `guests=2-11,12.2-11,12`

Search Attributes

Some partners need more granularity in their contracting, like setting special promotions for specific user groups (mobile, card holders, etc.). In order to provide this granularity you can provide any key/value combination during search, and those key/values can be later referenced inside contracts and affect the prices and conditions of the offers.

The format allows you to set both the keys and the values:

```
meta[key]=value&meta[another_key]=another_value
```

Example: `meta[platform]=mobile&meta[club]=banana+club`

NOTE

If you include the `meta` object during search, you MUST include the same keys and values on your `booking request` under the `meta` object. failing to do so might cause discrepancies between the searched conditions and the booked conditions.

Request Example

To search for 2 nights, with checkIn from 2023-01-01, 1 guest in one room, and customer country is Germany, you'll need to send the following call (with the appropriate authentication headers):

```
https://[search-endpoint-domain]/2.0/?checkIn=2023-01-01&nights=2&guests=1&hotelIds=1&customerNationality=DE
```

TIP

Make sure you always send the `Accept-Encoding` header as `gzip, deflate` for faster results and less bandwidth usage

Response

```

Object		Description
propertyId		the ID of the property (hotel or apartment) that this object refers to
propertyInfo		static information about the property
	name	name of the property
	starRating	number of stars the property holds (if applicable, 0 if not)
	cityName	Name of the city the property is in
	cityId	ID of the city the property is in
	countryName	Name of the country the property is in
	countryCode	Country code of the country the property is in
	regionName	Name of the region, if set
	regionCode	Code of the region, if set
	longitude	longitude of the property,
	latitude	latitude of the property,
	propertyType	Type of property (id),
	propertyTypeName	Type of property (name)
remarks		an array of strings, each detailing a remark that must be shown to the user prior to them completing a reservation
rooms		A collection of rooms available on the searches property, see below

Rooms

A collection of rooms available on the searches property

Object		Description
searchedPax		an object which details the pax for which it is suitable. This is useful in case you're searching for multiple rooms. The objects holds the number of adults and children corresponding with your search. Do not confuse this with the "Settings" objects (below) which details the capacity of the room
roomId		the internal ID of the room
roomTypeCode		the type of the room. Note that there is a suggested list of types, but each property can add their own types
roomName		The name of the room as set by the property
numberOfAvailableRooms		A number of the available rooms for this type
settings		
	numberOfBedrooms	Number of beds in the room
	roomSize	Room size in squared meters
	maxOccupancy	Maximum number of people allowed in this room, regardless of age

Object		Description
	maxAdultsNumber	Maximum number of adults allowed in this room
	maxChildrenNumber	Maximum number of children allowed in this room
	maxInfantsNumber	Maximum number of infants allowed in this room
	numberOfBeds	Number of beds in the room
	beddingConfigurations	a collection of objects describing the beds in the room
	beddingConfigurations - type	see the lookup section for a full list
	beddingConfigurations - size	Size in centimeters, if available (null if not)
	beddingConfigurations - quantity	Number of beds of that type
ratePlans		A list of rate plans available to book on this room
	ratePlanCode	The rate plan code as set by the property
	ratePlanId	The internal ID of the rate plan
	ratePlanName	The name of the rate plan
	ratePlanInfo	see the ratePlanInfo section below

Object		Description
	board	The board code of this rate plan
	remarks	a collection of strings which include the remarks set by the property for this rate plan. It is mandatory to show these remarks to the end customer before they finalize their reservation
	cancellationPolicies	An array of objects containing the rate plan specific cancellation policies. see cancellationPolicies section below for details
	payment	an object summarizing the payment and charge options of this rate plan. see the payment section below for details
	prices	a breakdown of the different price parts and types for the rate, see the prices section below for details
	nightlyBreakdown	a night-by-night breakdown of the different price parts and types for the rate, see the prices section below for details
	isImmediate	a boolean flag to indicate if this rate can be immediately confirmed or it will be set as <code>on-request</code> (<code>pending</code>) until manually confirmed by the property

ratePlanInfo

Field		Description
virtual		Indicates if the rate plan exists on the ARI Source or was generated by <code>HyperGuest</code>
contracts		an array of contracts that affects the specific rate plan conditions
	contractId	The ID of the contract this rate plan originated from
	term	ID and Name of the term(s) that affect this rate plan
originalRatePlanCode		If this rate plan is a virtual or auto-generated from contracting rules, what is the original rate plan code it is based on
isPromotion		Is this rate plan a promotion
isPackageRate		Can this can plan be sold without a package (also known as "Opaque rate")
isPrivate		Is this rate plan private or public

cancellationPolicies

cancellationPolicies - An array of objects containing the rate plan specific cancellation policies. Each object will look like this:

Field		Description
daysBefore		Days before check In date. this is kept for backwards compatibility.

Field		Description
penaltyType		Either currency (fixed amount), percent (from gross), or nights (starting from the first night).
amount		Penalty amount.
timeSetting		time before check in
	timeFromCheckInType	hours or days
	timeFromCheckIn	the amount of checkInType to deduct from the check-in cancellationDead
cancellationDeadlineHour		the hour on the day of the check-in (in 24H format) that will act as a pivot for the cancellation policy

example

In case we get the following object:

```
{
  "daysBefore": 1,
  "penaltyType": "nights",
  "amount": 1,
  "timeSetting": {
    "timeFromCheckIn": 12,
    "timeFromCheckInType": "hours"
  },
  "cancellationDeadlineHour": "10:00"
}
```

We need to take the day of the check-in (for example 2023-03-10) and calculate: `"2023-03-10 10:00" - 12 hours` which will be 2023-03-09 at 22:00. this is the effective date of the cancel policy which will apply a penalty of 1 night.

i NOTE

The cancellation penalty timing will always be determined based on the property's local timezone.

payment

Field	Description
charge	who is paying for the reservation, can be either "agent" or "customer"
chargeType	which price type the property is expecting? possible values are "net" or "sell"
chargeAmount	price and currency of the sum the hotel is expecting to get for the booking made on this rate plan

prices

This object describes the different price parts and types for the rate

Type	Field	Description
net		the NET price of this rate
	price	the net price value
	currency	the currency of the net price
	taxes	taxes applicable to the net price, see the taxes and fees section below
sell		the SELL price of this rate
	price	the sell price value

Type	Field	Description
	currency	the currency of the sell price
	taxes	taxes applicable to the sell price, see the taxes and fees section below
commission		the commission the property will pay for this rate
	price	the commission price value
	currency	the currency of the commission
bar		the BAR price (binding rate)
	price	the binding price value
	currency	the currency of the binding price
fees		fees attached to the reservation that could be made on this rate, see the taxes and fees section below

 WARNING

When selling the rate on any public or open asset it is forbidden to breach the **BAR**. The final customer price must never be below the binding rate specified in the response

taxes and fees

Taxes and fees are charges that are listed as part of the prices. [HyperGuest](#) already calculates the values of these charges, however some of them must be charged by the property directly, and cannot be included in the price. a common example is city taxes in various places around the world that the property must collect directly from the guest.

Field	Description
description	a textual description of the charge as entered by the property owner
amount	the price value of the charge
currency	the currency of the charge
relation	In order to distinguish between charges that are included in the price and charges that are not and cannot be included in the price, use the <code>relation</code> attribute. <code>included</code> means it's already part of the price, while <code>display</code> means it cannot be collected by you and must be paid by the guest directly to the property. You are required to show these charges to the guest prior to them making the reservation.

NOTE

Even if you choose to show your customer the final price without any taxes and fees breakdown, the `display` charges **must** be displayed prior to the customer finalizing the reservation, and clearly shown in the voucher.
